WATER SUPPLY OUTLOOK FOR IDAHO

and FEDERAL - STATE - PRIVATE COOPERATIVE SNOW SURVEYS

UNITED STATES DEPARTMENT of AGRICULTURE...SOIL CONSERVATION SERVICE, and

IDAHO STATE RECLAMATION ENGINEER

Data included in this report were obtained by the agencies named above in cooperation with Federal, State and private organizations listed inside the back cover of this report.

TO RECIPIENTS OF WATER SUPPLY OUTLOOK REPORTS:

Most of the usable water in western states originates as mountain snowfall. This snowfall accumulates during the winter and spring, several manths before the snow melts and appears as streamflow. Since the runoff fram precipitation as snow is delayed, estimates of snowmelt runoff can be made well in advance of its occurrence. Streamflaw forecasts published in this report are based principally on measurement of the water equivalent of the mauntain snawpack.

Farecasts became more accurate as more of the data affecting runoff are measured. All forecasts assume that climatic factors during the remainder of the snow accumulation and melt season as they affect runoff will add to be an effective average. Early season farecasts are therefore subject to a greater change than thase made on later dates.

The snow course measurement is abtained by sampling snaw depth and water equivalent at surveyed and marked lacations in mountain areas. A total of about ten samples are taken at each lacation. The average af these are reported as snow depth and water equivalent. These measurements are repeated in the same lacation near the same dates each year.

Snaw surveys are made monthly or semi-monthly fram January 1 through June 1 in most states. There are about 1400 snaw courses in Western United States and in the Calumbia Basin in British Columbia. In the near future, it is anticipated that autamatic snaw water equivalent sensing devices along with radio telemetry will provide a continuous record of snaw water equivalent at key locations.

Detailed data on snaw course and soil moisture measurements are presented in state and local reparts. Other data or reservoir storage, summaries of precipitation, current streamflaw, and soil moisture canditions at valley elevations are also included. The report for Western United States presents a broad picture of water supply outlook conditions, including selected streamflaw forecasts, summary af snow accumulation to date, and storage in larger reservairs.

Snow survey and soil moisture data for the periad of record are published by the Soil Conservation Service by states about every five years. Data far the current year is summarized in a West-wide basic data summary and published about October 1 of each year.

PUBLISHED BY SOIL CONSERVATION SERVICE

D. A. WILLIAMS, Administrator

The Soil Conservation Service publishes reports following the principal snow survey dates from January 1 through June 1 in cooperation with state water administrators, agricultural experiment stations and others. Copies of the reports for Western United States and all state reports may be obtained from Soil Conservation Service, Western Regianal Technical Service Center, Room 507, 701 N. W. Glisan, Portland, Oregon 97209.

Copies of state and local reports may also be obtained from state offices of the Soil Conservation Service in the following states:

WATER SUPPLY OUTLOOK for IDAHO

GENERAL SUMMARY FOR APRIL 1, 1968

Snowfall for the month of March was well below normal for the state of Idaho. The trend of light storms has persisted throughout the entire winter's season. The snowpack in general fell from 5% to 10% below the light snowpack measured as of March 1st. Snow cover now varies from 9% on the Palouse River to 113% on the Blackfoot River with most rivers running more than 20% below their normals.

The month was also unusually warm. Boise recorded the warmest average temperatures measured since 1934 which was an extremely warm, dry year. Temperatures at key stations indicate from 3 to 10 degrees above normal.

The forecasts of streamflow vary from 47% of average on the Big Wood River to 99% on Henrys Fork near Ashton. The major rivers with adequate storage facilities will have to draw on stored water early in the season to make up for the deficiency in streamflow. Water users with water rights based on the natural flow of rivers will be critically short if weather during the irrigation season remains near normal. Irrigators throughout the state are encouraged to use good water management practices to stretch supplies available for 1968. On many of the smaller rivers without adequate storage facilities or stored water, the water supplies are forecast to be so low that crop acreage reductions are strongly recommended.

Excellent soil moisture conditions exist at most of the valley and foothill elevations and beneath the snowpack at this time because of an early snow melt which has already started for this season. Water users are unusually sensitive for the need for normal spring rains to eliminate one irrigation and to assure even the low streamflow that is forecast.

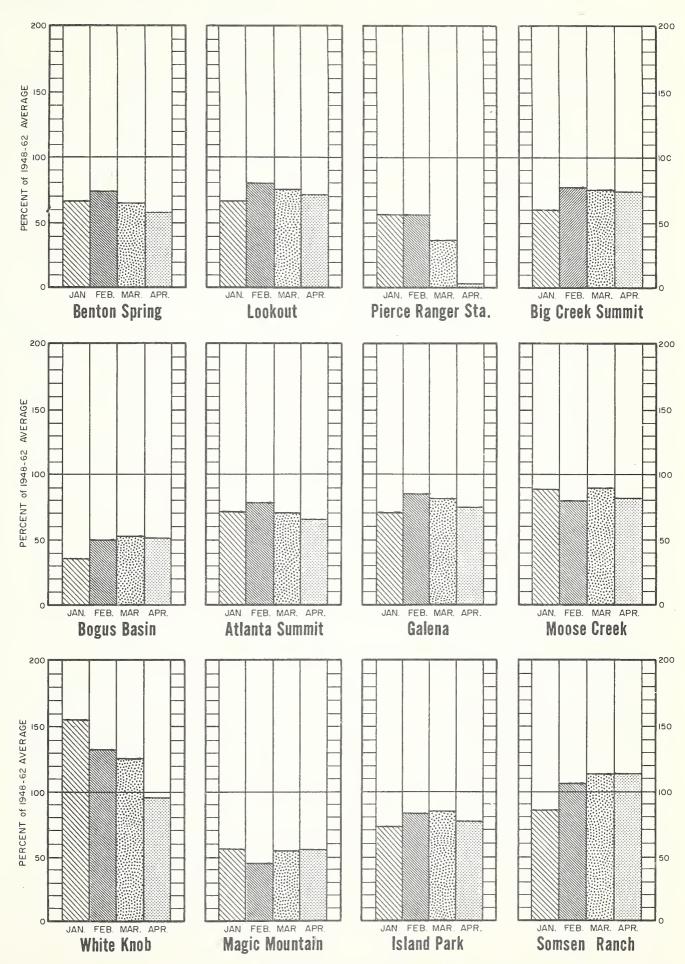

Farming operations in general have started two to three weeks early and irrigation water is already being used on several irrigation projects throughout the state. Technical recommendations for stretching water supplies are available in each community at the local offices of the Idaho Extension Service, the Soil Conservation District, and the Soil Conservation Service.

Streamflow during March was excessive in the northern half of the state and near normal in the eastern and southern portions. Reservoir stored water increased slightly, but the early spring to date will more than offset this condition if the weather trend continues.

Several key snow courses in Idaho report the water content of the snow-pack every day by radio telemetry. These daily reports can detect a change in storm patterns immediately if they should occur. The rate of snow melt is secondary data for guiding reservoir operations, but especially important on a dry year or one of extremely heavy snow cover.

Agencies and Organizations Cooperating in Idaho Snow Surveys

GOVERNMENT AGENCIES

Canada:

Department of Lands, Forests, and
Water Resources, British Columbia
Department of Resources and Development,
Water Resources Division

States:

Idaho State Reclamation Engineer
State of Idaho Department of Fish and Game
University of Idaho
Idaho State University
Montana Agricultural Experiment Station
Montana State Water Conservation Board
Nevada Cooperative Snow Surveys
Oregon Agricultural Experiment Station
Oregon Cooperative Snow Surveys
Oregon State Engineer and Corps of
State Watermasters
Utah Cooperative Snow Surveys
Wyoming Cooperative Snow Surveys

Federal:

- U. S. Army Engineers
- U. S. Department of Agriculture
 Forest Service
 Agricultural Research Service
- U. S. Department of Commerce Environmental Sciences Service Administration, Weather Bureau
- U. S. Department of the Interior
 Bonneville Power Administration
 Bureau of Reclamation
 Fish and Wildlife Service
 Water Resources Division, Geological Survey
 Indian Service
 National Park Service
 Bureau of Land Management

PUBLIC UTILITIES

The Montana Power Company Washington Water Power Company Idaho Power Company Utah Power and Light Company

ORGANIZED PUBLIC AGENCIES

Big Lost River Irrigation District
Boise Project Board of Control
Little Wood River Irrigation District
Jordan Valley Irrigation District
Salmon Falls Creek Irrigation Company
Twin Falls Soil Conservation District
Twin Lakes Irrigation Company
Big Wood Irrigation Company
Owyhee Project - North & South Board of Control

PRIVATE CORPORATIONS

Amalgamated Sugar Company

UNITED STATES DEPARTMENT OF AGRICULTURE SOIL CONSERVATION SERVICE P.O. BOX 38

BOISE, IDAHO 83707

OFFICIAL BUSINESS

FEDERAL - STATE - PRIVATE

COOPERATIVE SNOW SURVEYS

Furnishes the basic data necessary for forecasting water supply for irrigation, domestic and municipal water supply, hydro-electric power generation, navigation, mining and industry

"The Conservation of Water begins with the Snow Survey"
